

Email Archiving Principles

Glossary

- **mailbox** ... user's mail storage area on a mail server, keeps messages in folders, limited size.
- **mail client** ... (Thunderbird, Outlook, etc.) accesses mailbox via IMAP protocol (makes local copy of the mailbox on user's computer).
- **webmail client** ... accesses a mailbox via web browser
- **email archiving** ... systematic approach to saving and protecting the data contained in e-mail messages so it can be accessed quickly at a later date

Good to know

- Users must be aware of the **limited size of their institutional mailbox**.
- **Regular maintaining** of the mailbox **is recommended** (see below for details and hints).
- Users should **make regular backup** of their local archive folder

How to maintain your mailbox

There are several ways to achieve this:

1. unnecessary messages wiping (after deleting empty the recycle bin folder)
2. bigger attachments detaching (sort emails by size and deliberately remove the biggest attachments)
3. move messages to your computer mail folder (archiving to local archive) and make backup of your archive regularly then

Maintenance hints and tips

- check folder sizes (use webmail for this)
- remember to empty the recycle bin email folder
- preliminary message classification by durability (assign a folder, mark, tag, etc.)
- continuous processing non-actual, less important, temporary messages, e.g. sent copies with big attachments sorted by time, by size, filter (by tag, recipient etc.)

Email message archiving

- You can **archive** messages by moving them **toLocal folders** in your mail client (Thunderbird)
- **Make** immediately a **fresh copy of the local archive** to a different storage media (external disc, etc.)
- Be aware that your **local archive** is on your computer so its content **is not accessible via webmail**
